

STRATEGIC STEWARDSHIP BRIEF: 90-DAY OPERATIONAL ROADMAP

Prepared by: Mitul Tailor **Focus:** Infrastructure Integrity, Operational Sovereignty, & Asset Governance

EXECUTIVE SUMMARY

This roadmap outlines a disciplined transition into the IT Operations leadership role. Drawing on 11 years of independent site authority at Korn Ferry, my objective is to establish "Quiet Uptime" and ironclad asset governance. This plan ensures that from Day 1, the IT footprint is treated as a strategic business asset rather than a cost center.

PHASE 1: DAYS 1–30 | THE "GRIT" AUDIT & FOUNDATION

Objective: Rapid assessment of site integrity, CMDB accuracy, and stakeholder alignment.

- **Asset & CMDB Audit:** Perform a physical and digital reconciliation of all site assets. My goal is 100% CMDB accuracy to ensure total visibility of the technical footprint.
- **Operational Baseline:** Review current SLA performance and incident trends. Identify "Sore Spots" where recurring issues are impacting employee productivity.
- **Stakeholder Sync:** Establish a communication cadence with local business leads. As a "One-Man Army" at Korn Ferry, I learned that understanding business pain points is the first step to technical stability.

PHASE 2: DAYS 31–60 | HARDENING & PROCESS GOVERNANCE

Objective: Implementation of standardized ITIL-aligned protocols and proactive maintenance.

- **Standardization Initiative:** Align local workflows with global enterprise standards for onboarding/off-boarding, ensuring 100% Day-1 readiness for new hires.
- **Incident Reduction:** Move from reactive "break-fix" to proactive problem management. Use root-cause analysis to eliminate the top 20% of recurring support tickets.
- **Vendor Accountability:** Review vendor SLAs and performance. Ensure that third-party partners are meeting the high standards required for mission-critical stability.

PHASE 3: DAYS 61–90 | SCALABILITY & STRATEGIC CONTINUITY

Objective: Transition from stabilization to continuous improvement and long-term growth.

- **Operational Sovereignty:** Ensure the site is functioning as a self-sustaining unit with clear documentation, governed lifecycles, and predictive maintenance schedules.
- **Stewardship Reporting:** Present a formal "State of the Site" report to the CTO/CIO, detailing improvements in uptime, asset accuracy, and cost-saving optimizations.
- **Future-Proofing:** Identify infrastructure technical debt and propose a roadmap for the next 12 months to ensure the environment scales with the organization's growth.
